

NEUTRALLE®

Tank AutoFlush

ISSA InterClean was the launch of TC's new AutoFlush and AutoHygiene systems, designed for use in washrooms equipped with a header tank servicing multiple urinals. The Tank AutoFlush can be installed independently to work as a water management system providing 30 or 60 minute flushes 12 or 24 hours a day. The unit features patented Radius™ engineering technology, developed by Technical Concepts to deliver consistent, cost effective performance and long-term maintenance-free operation. A unique feature of Radius™ systems is 'dry' cam-gear componentry that, unlike other automated flushing systems that employ solenoid valves, keeps all electronics away from the water flow.

AutoHygiene system

The AutoHygiene system combines the Tank AutoFlush with the Best Impressions AutoSanitizer to deliver a solution to washrooms where water consumption needs to be reduced without compromising hygiene standards. The AutoSanitizer unit dispenses NEUTRALLE® Bio-Purinel formulation directly into the header tank at pre-programmed intervals, delivering millions of gram positive CFUs which continue to double every 20 minutes. With each flush the increased number of CFUs are delivered into the urinals where they feed on the uric scale build-up in traps, pipes and drains.
